

How Successful is Compass at Helping Patients?

Just as there is no one type of patient, there is no one way to define patient success.

Effect size is a statistical way to measure the impact that treatment has on patients. Effect sizes can be small, moderate, or large. The data shows that Compass has a large impact on treating a wide variety of presenting problems including depression, anxiety, trauma, OCD, and substance use.

Treatment Impact for Different Programs at Compass*

*Data from Q1-Q3 2024

Readmission after Successfully Discharging from Compass

The goal at discharge is to transition the patient to outpatient care and for the patient to not need to return to Compass. Having to readmit a patient soon after discharge means something did not go as planned. The readmission rates for successful discharges are very low at 1 month, 3 months, and 12 months post discharge, with as few as 1.5% of patients returning to Compass after 30 days. This is an incredible success!

Another way to measure success is by looking at how satisfied patients are with Compass. The vast majority (97%) of all Compass patients leave treatment satisfied or highly satisfied. Our satisfaction surveys also include comments regarding the patient’s experience. The comment below is a common example of the type of feedback we get from patients:

“Within hours of our intake we finally felt as though we could take a breath for the first time in months. Our daughter immediately had a team around her, all of whom worked cohesively and collaboratively to provide her with expert care. She is happier and more productive now than we have seen her in years”

Overall Patient Satisfaction

- Very Satisfied or Satisfied
- Very Dissatisfied or Dissatisfied
